

OPEN SOURCE SOFTWARE LICENSES EXPLAINED

Avoid legal issues by knowing which open source components are safe for commercial development.

Still worried? ActiveState offers indemnification for our Enterprise tier customers.

NO LICENSE

 **None**

Unfortunately, without a license, the code is copyrighted by default. Don't use it.

GPL BASED LICENSES

 **Mostly Copyleft**

The simple answer is "do not use with commercial products" since you'll need to share your code base with the community.

PUBLIC DOMAIN LICENSE

Permissive 

Use it! This is one of those rare cases where "free" is actually free.

MIT LICENSE

Permissive 

Fair game. Just make sure you distribute a copy of the MIT license terms and the copyright notice with your final product.

ECLIPSE PUBLIC

 **Mostly Copyleft**

It requires source code disclosure and therefore shouldn't be used if you're working on a commercial product.

BSD-LIKE LICENSES

Permissive 

Includes BSD 2 and 3 licenses, all of which are good to use as long as you make sure to include the BSD license and copyright notice.

APACHE 2 LICENSE

Permissive 

Make sure you include the copyright, license and any notices, as well as state any changes you made to the original code.

MOZILLA 2 PUBLIC

 **Copyleft**

Similar to GPL, it requires source code disclosure and therefore shouldn't be used if you're working on a commercial product.

MICROSOFT PUBLIC

Permissive 

Just make sure you distribute a copy of the license terms and the copyright notice with your final product.
